(54) 5-PYRIDYL-1,3-AZOLE COMPOUNDS, PROCESS FOR PRODUCING THE SAME AND USE THEREOF

(57) An optionally N-oxidized compound represented by the formula:

wherein R<sup>1</sup> represents hydrogen, hydrocarbon, heterocycle, amino, acyl, R<sup>2</sup> represents an aromatic group, R<sup>3</sup> represents hydrogen, pyridyl, aromatic hydrocarbon, X represents oxygen, optionally oxidized sulfur, Y represents a bond, an oxygen, optionally oxidized sulfur, a group represented by the formula NR<sup>4</sup> (R<sup>4</sup> represents hydrogen, hydrocarbon or acyl) and Z represents a bond or a divalent acyclic hydrocarbon, or a salt thereof has an excellent adenosine A<sub>3</sub> receptor antagonistic activity and is used as an agent for preventing or treating diseases related to an adenosine A<sub>3</sub> receptor. Furthermore, the compound (I) or a salt thereof has p38 MAP kinase inhibitory activity and TNF- $\alpha$  inhibitory activity and is used as an agent for preventing or treating diseases related to p38 MAP kinase and diseases related to TNF- $\alpha$ .

**Description****Technical Field**

5 [0001] The present invention relates to novel 5-pyridyl-1,3-azole compounds having an excellent medical action, particularly an adenosine A<sub>3</sub> receptor antagonistic activity, a p38 MAP kinase inhibitory action, a TNF- $\alpha$  production-inhibitory action and the like, a process for producing the same, a pharmaceutical composition and so on.

**Background Art**

10 [0002] As a subtype of an adenosine receptor, A<sub>1</sub>, A<sub>2a</sub>, A<sub>2b</sub> and A<sub>3</sub> are known. Adenosine exhibits tracheostenotic action to an asthma patient and, on the other hand, theophylline which is an agent for treating asthma exhibits adenosine antagonism. In addition, it has been recently shown that the activation of A<sub>3</sub> receptor in a rat causes degranulation from mast cells (Journal of Biological Chemistry, vol.268, 16887-16890, 1993), and that A<sub>3</sub> receptor is present on 15 eosinophils in peripheral blood and its stimulation activates phospholipase C (PLC) to increase the intracellular calcium concentration (Blood, vol.88, 3569-3574, 1996).

20 [0003] In addition, cytokines such as TNF- $\alpha$  (tumor necrosis factor- $\alpha$ ), IL-1 (interleukin-1) and the like are biological substances which are produced by a variety of cells such as monocyte or macrophage in response to the infection and other cellular stress (Koj, A., Biochim. Biophys. Acta, 1317, 84-94 (1996)). Although these cytokines play an important role in the immune response when they are present at an appropriate amount, it is thought that the overproduction is associated with a variety of inflammatory diseases (Dinarello, C.A., Curr. Opin. Immunol., 3, 941-948 (1991)). p38 MAP kinase which was cloned as a homologue of MAP kinase is associated with the control of production of these cytokines and signal transduction system coupled with a receptor and there is a possibility that the inhibition of p38 MAP kinase becomes a drug for treating inflammatory diseases (Stein, B., Anderson, D., Annual Report in Medicinal Chemistry, 25 edited by Bristol, J.A., Academic Press, vol.31, pages 289-298, 1996).

[0004] Hitherto, as a compound exhibiting the selective antagonism for adenosine A<sub>3</sub> receptor, xanthine derivatives are reported in GB-A-2288733 and WO 95/11681 and the following compounds are reported in Journal of Medicinal Chemistry, vol.40, 2596-2608, 1997:

30

35

40

50

55

[0005] In addition, in WO 97/33879, there are described an adenosine A<sub>3</sub> receptor antagonistic agent containing a compound represented by the formula:

wherein R represents hydrogen, chlorine, bromine, fluorine, iodine, hydroxy, C<sub>1-4</sub> alkyl, C<sub>1-4</sub> alkoxy or C<sub>1-4</sub> alkylcarboxy, or a salt thereof and, more specifically, a compound

35 is described.

[0006] In addition, as a compound having a p38 MAP kinase inhibitory action, imidazole derivatives are described in JP-T 7-50317 (WO 93/14081) and oxazole derivatives are described in JP-T 9-505055 (WO 95/13067), respectively.

[0007] On the other hand, as thiazole compounds, the following compounds are known:

40 1) 1,3-thiazole derivatives represented by the formula:

50 wherein R<sup>1</sup> represents a cycloalkyl group, a cyclic amino group, an amino group optionally having, as a substituent, 1 or 2 lower alkyl, phenyl, acetyl or lower alkoxy carbonyl acetyl, an alkyl group optionally having, as a substituent, hydroxyl, carboxyl or lower alkoxy carbonyl, or a phenyl group optionally having, as a substituent, carboxyl, 2-carboxyethenyl or 2-carboxy-1-propenyl, R<sup>2</sup> represents a pyridyl group optionally having, as a substituent, lower alkyl, R<sup>3</sup> represents a phenyl group optionally having, as a substituent, lower alkoxy, lower alkyl, hydroxyl, halogen or methylenedioxy, or salts thereof, which have analgesic, antipyretic, anti-inflammatory, anti-ulcerative, thromboxane A<sub>2</sub> (TXA<sub>2</sub>) synthesizing enzyme-inhibitory, and platelet coagulation-inhibitory activities (JP-A 60-58981),

55 2) 1,3-thiazole derivatives represented by the formula:

10 wherein R<sup>1</sup> represents an alkyl group, an alkenyl group, an aryl group, an aralkyl group, a cycloalkyl group, a heterocyclic group employing carbon as an attachment point or an amino group optionally having substituents, R<sup>2</sup> represents a pyridyl group optionally substituted with an alkyl group, R<sup>3</sup> represents a phenyl group optionally having substituents, or salts thereof, which have analgesic, antipyretic, anti-inflammatory, anti-ulcerative, TXA<sub>2</sub> synthesizing enzyme-inhibitory, and platelet coagulation-inhibitory activities (JP-A 61-10580),  
 3) 1,3-thiazole derivatives represented by the formula:

 25 4) imidazole derivatives represented by the formula:

35 40 which have an anti-cancer activity and a cytokine inhibitory activity, more specifically, the following compounds are described (WO 97/12876):

[0008] Since an adenosine A<sub>3</sub> antagonist, a p38 MAP kinase inhibiting agent and a TNF- $\alpha$  production-inhibiting agent having the satisfactory activity and effect, safety, (oral) absorption, (metabolism) stability and the like have not been found, it is desired the development of the excellent adenosine A<sub>3</sub> receptor antagonist, the p38 MAP kinase-inhibiting agent and the TNF- $\alpha$  production-inhibiting agent as a pharmaceutical which are effective for preventing or treating adenosine A<sub>3</sub> receptor-related diseases, cytokine-mediated diseases and the like.

[0272] Although a product can be used as the reaction solution itself or as a crude product in the next reaction, it can be isolated from the reaction mixture by the conventional method, and can be easily purified by a separating means such as recrystallization, distillation, chromatography and the like.

[0278] It is advantageous that this reaction is performed without a solvent or in the presence of an inert solvent for a reaction. The solvent is not particularly limited as long as a reaction proceeds but, for example, halogenated hydrocarbons, aliphatic hydrocarbons, aromatic hydrocarbons, ethers, amides, alcohols, nitriles or a mixture of two or more of them and the like are used.

[0279] A reaction temperature is usually about -5 to about 200°C, preferably about 5 to about 150°C. A reaction time is usually about 5 minutes to about 72 hours, preferably about 0.5 to about 30 hours.

[0280] Although a product can be used as the reaction solution itself or as a crude product in the next reaction, it can be isolated from the reaction mixture by the conventional method, and can be easily purified by a separating means such as recrystallization, distillation, chromatography and the like.

[0281] In the above respective reactions, when starting compounds have amino, carboxy, hydroxy as substituents, a protecting groups which are generally used in the peptide chemistry or the like may be introduced into these groups and, after reaction, a desired compound can be obtained by removing protecting groups if needed.

As these substituents, halogen atoms (for example, fluorine, chlorine, bromine, iodine and the like), C<sub>1-6</sub> alkyl-carbonyl (for example, acetyl, propionyl, butylcarbonyl and the like), nitro, C<sub>1-6</sub> alkyl (for example, methyl, ethyl, tert-butyl and the like), C<sub>6-10</sub> aryl (for example, phenyl, naphthyl and the like) and the like are used and the number of substituents is 1 to 3.

[0429] Acetyl chloride (0.26 mL, 3.7 mmol) and 4-dimethylaminopyridine (0.09g, 0.76 mmol) were added to a solution of N-[4-[2-amino-4-(3,5-dimethylphenyl)-1,3-thiazol-5-yl]-2-pyridyl]benzamide (0.96 g, 2.4 mmol) in N,N-dimethylacetamide (20 mL) and the mixture was stirred at 70°C for 16 hours. After the reaction mixture was cooled to room temperature, a saturated aqueous solution of sodium hydrogencarbonate (50 mL) was added. The resulting crude crystals were collected by filtration and washed with water. The crude crystals were recrystallized from ethyl acetate to obtain 0.32 g (yield 30%) of the title compound.
